

Effects of Hurricane Katrina on Children's Blood Lead Levels

It is unlikely that children's blood lead levels will increase as a result of the hurricane even though the lead levels in some flood water exceed drinking water standards. While purifying water by boiling does not remove lead, children are unlikely to drink large amounts of flood water. Inorganic lead is not absorbed through the skin except in tiny amounts.

Topics of concern

- Some parents of children with elevated blood lead levels may request blood lead testing at the evacuation centers. These requests should be accommodated if at all possible.
- Children cannot give lead poisoning to other children.
- Concerns about potential lead exposure should not interfere with meeting the housing needs of displaced families. Lead programs across the country and at CDC can provide information about measures that reduce the chance of lead exposure. Information can also be found at www.cdc.gov/nceh/lead.
- When cleanup of the affected areas begins, caution must be taken in disposing of lead-painted building components. To avoid widespread lead contamination and exposure to vulnerable populations, these components should not be burned in open areas nor should they be cleaned by uncontrolled sanding or scraping of lead-based paint.

Children with Elevated Blood Lead Levels (1997–2003) in States Affected by Hurricane Katrina

Year	State	Number of Children Tested	Total Confirmed Children BLLs ≥ 10 $\mu\text{g}/\text{dL}$	Confirmed BLLs ≥ 10 $\mu\text{g}/\text{dL}$ as % of Children Tested
1997	Alabama	22,875	1,501	6.56%
1998		17,827	988	5.54%
1999		17,660	549	3.11%
2000		13,719	315	2.30%
2001		12,107	642	5.30%
2002		22,495	454	2.02%
2003		21,307	503	2.36%
1997	Louisiana	N/A	N/A	N/A
1998		23,168	551	2.38%
1999		21,587	690	3.20%
2000		30,805	1,023	3.32%
2001		44,458	1,061	2.39%
2002		54,205	1,044	1.93%
2003		61,668	982	1.59%
